

Geometric contradiction detection: a firm cluster

Cluster representational-geometry-109123c7

Theseus Auto-Paper Generator

May 2026

Disclosure: machine-drafted, founder-reviewed.

Lead conclusion: **conclusion-representational-geometry-1**.

Methodology root: **profile-representational-geometry-1** (representational-geometry).

Abstract

This paper distills 2 firm conclusion(s) anchored on conclusion-representational-geometry-1, all sharing the methodology root "Geometric contradiction detection". The cluster's claims are stress-tested against 1 resolved forecast(s) drawn from the firm's calibration ledger. Lead claim: The geometry of a claim reveals a contradiction before the semantics of the claim does.

1 Introduction

The Theseus engine routinely produces firm conclusions, attaches them to a methodology profile, and tracks how those conclusions perform when their predictive consequences are settled in public forecast markets. This paper presents one such cluster of 2 conclusion(s), drawn together by their shared methodology root and by at least one resolved forecast that touches the cluster. The cluster's lead claim states: "The geometry of a claim reveals a contradiction before the semantics of the claim does.".

Conclusions in this cluster

- **conclusion-representational-geometry-1** [row:conclusion:conclusion-representational-geometry-1]
— The geometry of a claim reveals a contradiction before the semantics of the claim does.
- **conclusion-representational-geometry-2** [row:conclusion:conclusion-representational-geometry-2]
— A contradiction shows up in the angle between a claim and its negation before it shows up in a close read.

2 Methods

The cluster shares a single methodology root, *Geometric contradiction detection* (**profile-representational-geometry-1** pattern *representational-geometry*).

Summary. Read the geometry of a claim’s embedding to catch a contradiction before a semantic reading would.

Reasoning moves

- embed the claim and its negation
- measure the angle before reading the sentences

Assumptions

- the embedding geometry tracks semantic contradiction

3 Results

The cluster’s conclusions were stress-tested against 1 resolved forecast(s) from the firm’s calibration ledger. Each row below resolves to a database record.

Headline	Outcome	Stated	Brier	Row
Geometric contradiction de- tection: claim 1 holds	YES	0.70	0.090	[row:forecast_resolution:prediction]

Across the 1 fully-scored forecast(s) above, the firm achieved a mean Brier score of 0.090. Each contributing row is auditable via its `\rowref{...}` marker.

4 Discussion

Reviewer firm-peer-review on conclusion-representational-geometry-1: verdict revise (confidence 0.78).

Peer-review findings

- **minor** — One supporting signal rests on a single source; triangulate before widening the claim.
[row:review_report:review-representational-geometry-seed]

5 Limits and failure modes

[TODO: methodology root has no registered failure modes; manual review required before publication]

6 References

1. Firm source memo: Geometric contradiction detection, May 2026 [row:artifact:artifact-representational-g

This paper was machine-drafted by Theseus from the firm’s existing artifacts. Every numerical claim resolves to a row in the firm’s database (see [row:...] markers). The .tex source is the authoritative artifact; the PDF is a build product.
